

49-VW-02

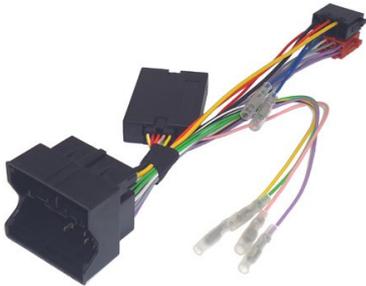

Volkswagen group CANbus interface

InCarTec

49-VW-02

Quadlock CANbus steering control interface for Volkswagen, Seat and Skoda vehicles with PDC and climate control display retention.

This interface provides steering wheel control commands to the new head unit and gives CAN signal outputs; speed pulse (pink wire), illumination (orange wire), reverse gear (purple wire) and hand brake (green wire). It also allows the PDC and climate control information to be displayed on the car's white display on the instrument cluster. This interface also has amplifier turn on and control features.

When installing, make sure the patch lead (49- series) is connected to the interface before the interface is connected to the vehicle harness.

*Short press answer / Long press reject

This interface displays climate control information and parking sensors visuals on the car's original white display.

This feature does not work if the car has a red display.

Amplifier settings.

To access amplifier settings, have the white display set on audio and press and hold OK button for 5 seconds. AMP Settings will be displayed.

Use the volume buttons to change the amplifier volume, the press OK when done.

Now use the volume buttons to set the fader control. Press OK when done.

Press OK to confirm settings and leave the menu.
